Date: October 2016
Author: Jack Gerrard
Version: 4.2

This latest release introduces new modules, new features and enhancements as notified and/or requested in uniCenta forums along with other directly and un-reported items.

This Readme and other Guides are made available to uniCenta Customers only.

Source code access is available to uniCenta Customer Subscribers only.

Upgrades do not include beta to release versions.
Any uniCenta oPOS Beta versions should not be run in production or live environments nor connected to a production or live MySQL database.

Enjoy!

Jack

INSTALLERS

It is highly recommended you install, test and review version 4.2 on a separate machine to ensure it meets your requirements and when satisfied; installed on a live or production machine.

When installing on the same machine as an existing uniCenta oPOS installation it will pre-load configuration settings from the existing \user\unicentaopos.properties file. This file will be over-written with any configuration changes you may make during the new installation.

Installers should be run using a User account with Administrator permissions

Windows XP through to Windows 10
1. Run the latest unicentaopos-4.2-windows-installer.exe and install into a new folder, if required, called for example; unicentaopos42
2. Run the start.bat or unicentaopos4.2.jar directly

NEW Linux (Debian/Ubuntu)
1. Run the latest unicentaopos-4.2-linux-installer.run and install into a new folder, if required, called for example; unicentaopos42
2. Set execute permissions if required
3. Run the start.sh or unicentaopos4.2.jar directly

NEW Linux 64(Debian/Ubuntu)
1. Run the latest unicentaopos-4.2-linux-x64-installer.run and install into a new folder, if required, called for example; unicentaopos42
2. Set execute permissions if required
3. Run the start.sh or unicentaopos4.2.jar directly

NEW **Apple Mac OS X 10.6 and later**
1. Run the latest unicentaopos-4.2-osx-installer.app and install into the Applications folder (default)
2. Set execute permissions if required
3. Run the start.sh or unicentaopos4.2.jar directly
